

# Automate

Test and release code faster than ever with automated cross-browser testing.

## THE MOST RELIABLE INFRASTRUCTURE FOR TEST AUTOMATION

Scale your testing with a cloud infrastructure that lets you run thousands of tests across different browsers in parallel. Ship web apps and sites with confidence, knowing critical scenarios are fully tested and work for every customer. Use Automate to easily validate code quality, detect high-risk bugs pre-release and accelerate time to market. Everything on Automate works out of the box and requires zero setup or maintenance. Learn more about Automate at: [browserstack.com/automate](https://browserstack.com/automate).

### Ship Quality at Scale

Remove risks of undetected defects making it to production by expanding your code coverage through automation. Test in all your target browsers, choosing from over [1,200 combinations](#) of browsers, devices and operating systems. Always ship with the confidence of delivering high-quality software.

### Get Software to Customers Faster

End the bottleneck of repetitive manual QA. Leverage [parallelization](#) to run thousands of complex test cases in minutes, cutting build time by more than 10x. Faster build times mean faster releases, and ultimately more time to focus on customer and business needs.

### Test on Real Devices, Without Spending a Fortune

While testing on physical devices is costly and high-maintenance, the alternative—emulators—gives inaccurate results. Our global network of data centers replaces your in-house device labs with the Real Device Cloud—a mobile infrastructure with thousands of popular devices available on demand 24/7. All mobile tests on Automate run on physical devices, ensuring tests results are 100% accurate.

### Debug and Fix Instantly

Quickly identify, reproduce and solve issues in your web apps and sites. Get to the root cause of any error using [comprehensive debugging tools](#). Automate makes it easy to verify various aspects of software quality: usability, functionality and performance. Use our native integrations to file bugs across teams on Jira and Trello without switching tools.

### Integrate in Minutes

Automate fits right into your test setup and workflows. Reuse existing Selenium, Appium or other test suites, or get started with the language or framework of your choice. Power continuous testing in your build process by integrating Automate with your [continuous integration tool](#).

### Get Enterprise Security

Rest assured your data is securely managed on Automate. After each test session, everything is wiped clean across browsers, devices and operating systems, and restored to initial settings. We ensure every session runs on a secure, pristine browser. Read our [Security policies](#) to learn more.

“ We would be stuck in our tracks if our site went down. That’s the biggest fear as a front-end developer, that you are going to inadvertently push code that works on one browser but not on another. There’s no way you’re going to get the sort of browser coverage you need without using BrowserStack. It’s a force multiplier. I can troubleshoot 10 times faster just by looking at the video log or screenshot. ”
