

TESTDRIVER[®]

Easy benchmark automation

Benchmarks are essential tools for testing and comparing PC performance. But manually benchmarking more than a few systems at a time can quickly become time-consuming and inefficient.

Testdriver makes benchmark automation easy. With Testdriver, there is no need to be physically present at the tested PCs. Deploy and run benchmarks on any PC in a organisation from one central control console. Testdriver can benchmark hundreds, even thousands, of client systems simultaneously. The results are collected and stored in a central database for easy access and reporting.

Install

Remotely install and run benchmarks over your network. Testdriver client manages benchmark installs and uninstalls, and can trigger automatic updates on the client machines.

Schedule & run

Define the sets of benchmarks and target systems for testing, then schedule the runs. Check the running status and monitor progress for each system under test.

Report

Automatically collect and store all benchmark results in one central database. Search, sort, and filter the results. Save PDF reports or export the data to Microsoft Excel or CSV files for further analysis.

Intended use cases

Enterprise IT: Replace costly and time-consuming field inspections with centrally managed remote testing and monitoring. Testdriver can help avoid costly wastage by replacing systems only when needed rather than following a fixed time-based schedule. Use it to evaluate the impact of software updates on a select set of systems before rolling the update to all users.

Production line: Automate the testing of devices coming off the production line, which saves time, reduces errors, improves reporting, and ensures quality. Testdriver also provides database access to historical test data allowing device manufacturers to quickly identify trends and remedy problems.

IT procurement: Testdriver helps purchasers specify PC performance with benchmark scores. This makes it easy to compare tenders and avoids overspending on overspecified PCs, making savings from fair and open vendor competition.

- Save your company time and money with easy benchmark automation.
- Set up, schedule, and run benchmarks on any PC connected to your network.
- Testdriver supports an unlimited number of client systems and runs.
- Collect and store your benchmark results in your own database automatically.
- Powerful reporting, charts, and data analysis.
- Supports the latest benchmarks from UL: PCMark 10, PCMark 8, 3DMark, and VRMark.
- You can also deploy third-party benchmarks, applications, and system updates.
- Simple to setup and use. Testdriver runs on a Windows PC or server.

Licensing

Annual licenses available for Testdriver. Benchmark licenses purchased separately.
